Synthetic studies toward citrinadin A: construction of the pentacyclic core

Monica E McCallum, Genessa M Smith, Takanori Matsumaru, Ke Kong, John A Enquist Jr and John L Wood

This manuscript describes the preparation of an advanced intermediate toward the total synthesis of citrinadin A, featuring a [3+2] cycloaddition employing *in situ* generation of the dipole.

The Journal of Antibiotics (2016) 69, 331–336; doi:10.1038/ja.2016.25; published online 9 March 2016

INTRODUCTION

In the early 2000's, Kobayashi and coworkers¹ reported the isolation of two secondary metabolites, citrinadin A and B, from the marine fungus *Penicillium citrinum* N059. Structural determination efforts by Kobayashi revealed that the two congeners possess the same complex spirooxindole-containing pentacyclic core and differ only by an *N,N*-dimethylvaline appendage resident on citrinadin A (cf. **1** and **2**, Figure 1, top).

The interesting structural features of these compounds have led several groups to begin exploring their total syntheses. Recently our efforts and those of the Martin group led to completed syntheses of citrinadin B and A, respectively. These efforts independently led to the conclusion that the structures assigned by Kobayashi were sound in terms of connectivity, but required revision at the stereochemical level.^{2–5} As illustrated in Figure 1 (bottom), the reassigned structures of citrinadins A and B differ at the stereogenic centers residing within the pentacyclic core. Herein, we report synthetic efforts toward citrinadin A (**3**) that have now resulted in the stereoselective preparation of its core structure.

RESULTS AND DISCUSSION

Citrinadin A possesses several synthetically challenging features, including an epoxy ketone side chain and a rare *N,N*-dimethylvaline ester. We envisioned that both of these moieties would be installed at a late stage, a maneuver that was particularly important for the delicate epoxy ketone. Thus, from a retrosynthetic perspective, citrinadin A was seen as arising from **5**, wherein an aryl bromide is poised for installation of the epoxy ketone side chain, and a masked alcohol will enable installation of the ester through a Mitsunobu reaction (Scheme 1). Epoxide **5** would be available from pentacycle **6** via reductive cleavage of the isoxazolidine N–O bond and subsequent quinolizidine formation. The isoxazolidine **6** would result from the intermolecular [3+2] cycloaddition of enone **7** and nitron **8**. The requisite enone is the same as that employed in our previous synthesis

of citrinadin B, whereas the nitron was expected to arise from known diol **11** (*vide infra*).

During our initial studies towards citrinadin A,⁶ we attempted to preform the nitron before cycloaddition. Although this approach was successful in our synthesis of citrinadin B, under similar conditions **8** performed poorly. After considerable experimentation, we eventually turned to a strategy that employed *in situ* generation of the requisite nitron.⁶ As illustrated retrosynthetically in Scheme 2, delivery of the nitron would follow from desilylative cyclization of *tert*-butyl dimethylsilyl (TBS)-protected oxime **10**, which in turn would arise from the known diol **11**.⁷

In the forward sense, known diol **11** was converted to the known lactone **12** using a sequence previously reported by Nakamura *et al.*⁷, which involved exposure to pyridinium *p*-toluenesulfonate (PPTS) in refluxing dichloroethane, followed by *tert*-butyl diphenylsilyl (TBDPS) protection (Scheme 3) (nitron precursor **10** was prepared using racemic ethyl-3-hydroxybutyrate in lieu of (*S*)-3-hydroxybutanoate as described in Nakamura *et al.*⁷). Subsequent treatment of **12** with diisobutyl aluminum hydride (DIBAL-H) furnished the corresponding lactol **13** as a 1:1 mixture of diastereomers which, upon exposure to hydroxylamine hydrochloride, underwent smooth conversion to oxime **14** as a 1:1 mixture of *E* and *Z* isomers. Conversion of **14** into a substrate suitable for desilylative cyclization required initial TBS protection of the oxime alcohol and activation of the remaining secondary alcohol through tosylation.

Having prepared racemic nitron precursor **10**, we began to explore its ability to undergo cycloaddition with the previously prepared racemic enone **7**. As alluded to above, attempts to employ the preformed nitron met with limited success. Thus, we began investigating generation of the nitron *in situ* and, after an exhaustive screen of fluorine sources, solvents, and ratios of **7**–**10**, we discovered that tetrabutylammonium difluorotriphenylsilicate (TBAT) in benzene with three equivalents of **10** gave the best overall result (Scheme 4).⁶

We were pleased to learn that unlike the nitron cycloaddition used en route to citrinadin B, which required 9 days, the reaction of **7** with

10 furnished the desired cycloadduct in just 24 h.⁸ Although **15b** was the minor diastereomer, we have demonstrated in preliminary studies that use of enantioenriched **7**,⁵ gives a diastereomeric ratio (d.r.) of 3:2, whereas use of enantioenriched **7** and enantioenriched **10**, derived from commercially available chiral ethyl-3-hydroxybutyrate, gives a d.r. of 2:1. Fortunately, **15a** and **15b** were separable via flash column chromatography, thus in these early studies, we were able to continue advancing the desired cycloadduct (**15b**) towards citrinadin A.

Toward this end, **15b** was treated with trimethylsulfoxonium iodide and sodium hydride (Scheme 5). The derived Corey–Chaykovsky adduct (**16**) was stereoselectively produced in good yield.^{9,10} Subsequent exposure of **16** to trimethylsilyl chloride and NaI promoted intramolecular attack on the epoxide by the isoxazolidine nitrogen to furnish an ammonium salt (**17**), which was then reduced with zinc in AcOH to give diol **18**, thereby completing construction of the core

ring system.¹¹ This began setting the stage for eventual incorporation of the angular nitrogen atom. Thus, the least hindered alcohol in **18** was activated for displacement by treating with MsCl and Et₃N. Subsequent exposure of the derived mesylate to K₂CO₃ promoted the formation of key intermediate **19**, wherein the ring-fusion epoxide stands ready to mediate incorporation of the final nitrogen.

CONCLUSION

In summary, we have prepared a late-stage intermediate en route to citrinadin A with an approach that employs an intermolecular [3+2] nitrono cycloaddition. The latter was found to best proceed under conditions wherein the nitrono is produced *in situ* and, although the cycloaddition was performed with racemic substrates, its stereochemical outcome clearly indicates that enantioenriched substrates will selectively deliver material required for preparation of the natural

product. These efforts have also illustrated that the derived cycloadduct can be advanced to an intermediate (**19**) that contains all of the functional groups required for conversion to citrinadin A. The aryl bromide will allow for attachment of the epoxy ketone, removal of the TBDPS group will set the stage for introduction of the valine ester via a Mitsunobu reaction, and opening of the ring-fusion epoxide will provide access to the requisite anti relationship between the methylamine and alcohol substituents. Work toward these ends is underway and will be reported in due course.

EXPERIMENTAL PROCEDURE

General

Unless otherwise noted, all reactions have been carried out with distilled and degassed solvents under an atmosphere of dry N₂ in oven- (135 °C) or flame-dried glassware with standard vacuum-line techniques. Triethylamine, diisopropylamine and methanol were dried over calcium hydride and freshly distilled. Benzene, tetrahydrofuran, methylene chloride, toluene, acetonitrile and diethyl ether were dried using a solvent purification system manufactured by SG Water U.S.A., LLC (Nashua, NH, USA) as follows: tetrahydrofuran, diethyl ether, acetonitrile and methylene chloride were passed through two packed columns of neutral alumina, whereas benzene and toluene were passed through a column of alumina and a column of Q5. All other commercially available reagents were used as received.

Unless otherwise stated, all reactions were monitored by TLC using glass-backed extra hard layer, 60 Å plates (Indicator F-254, 250 µm, Silicycle, Ville de Québec, QC, Canada). Column or flash chromatography was performed with the indicated solvents using Silicycle SiliaFlash P60 (230–400 mesh) silica gel as the stationary phase. All melting points were obtained on a Gallenkamp capillary melting point apparatus (model: MPD350.BM2.1, Sanyo Electric Co., Ltd., Osaka, Japan) and are uncorrected. IR spectra were obtained using a Nicolet Avatar 320 FTIR (Thermo Electron Corporation, Madison, WI, USA) or Bruker Tensor 27 FTIR (Bruker Optics Inc., Billerica, MA, USA). ¹H and ¹³C NMR spectra were recorded on a Varian Inova 500, Varian Inova 400, Varian Inova 400 autosampler, or Varian Inova 300 spectrometer (Varian, Inc., Palo Alto, CA, USA). Chemical shifts (δ) are reported in p.p.m. relative to internal residual solvent peaks from indicated deuterated solvents. Coupling constants (*J*) are reported in Hertz (Hz) and are rounded to the nearest 0.1 Hz. Multiplicities are defined as: s=singlet, d=doublet, t=triplet, q=quartet, m=multiplet, dd=doublet of doublets, dt=doublet of triplets, ddd=doublet of doublet of doublets, dddd=doublet of doublet of doublet of doublets, br=broad, app=apparent, par=partial. HRMS were performed at the Central Instrument Facility by Donald L. Dick of Colorado State University.

Lactol 13. Lactone **12** (3.2 g, 8.7 mmol) in dichloromethane (90 ml) was cooled to –78 °C for the addition of diisobutylaluminum hydride solution (1 M in hexanes, 9.6 ml, 9.6 mmol). This was stirred cold for 2 h at which time the reaction was quenched at –78 °C with methanol (9 ml) and allowed to warm to room temperature. The resulting reaction solution was vigorously stirred with an added solution of Rochelle's salt (9 g in 100 ml H₂O) for 1 h. Following separation of the layers, the aqueous portion was extracted with diethyl ether, and the combined organics were washed with brine, dried over sodium sulfate (Na₂SO₄) and concentrated to provide lactol **13** as a 1:1 mixture of anomers (3.2 g, 100% yield), which was used in the next step without further purification. ¹H NMR (400 MHz, CDCl₃) δ 7.71–7.68 (m, 8H), 7.46–7.36 (m, 12H), 5.30 (br, t, 1H), 4.50 (ddd, *J*=9.7, 6.6, 2.1 Hz, 1H), 4.22 (m, 1H), 3.91 (m, 2H), 3.79 (tt, *J*=10.9, 4.8 Hz, 1H), 3.31 (dq, *J*=11.6, 5.9, 1.9 Hz, 1H), 3.01 (t, *J*=2.6 Hz, 1H), 2.09 (ddt, *J*=12.2, 4.4, 2.1 Hz, 1H), 1.98 (ddt, *J*=12.8, 4.7, 1.7 Hz, 1H), 1.76 (m, 2H), 1.60 (dddd, *J*=12.9, 11.0, 3.6, 2.0 Hz, 1H), 1.48–1.26 (m, 3H), 1.19 (d, *J*=6.2 Hz, 3H), 1.11 (d, *J*=6.3 Hz, 3H), 1.08 (s, 9H), 1.07 (s, 9H); ¹³C NMR (100 MHz, CDCl₃) δ 135.83, 134.60, 134.48, 134.24, 134.13, 129.84, 129.82, 129.70, 129.69, 127.76, 127.74, 127.67, 127.65, 94.39, 92.93, 68.28, 68.16, 65.14, 64.16, 43.30, 42.61, 42.29, 39.51, 27.07, 27.01, 21.51, 21.27, 19.24, 19.19; IR (thin film): 3398 (br, m), 2932 (m), 2858 (m), 1428 (m), 1112 (s), 702 (s) cm⁻¹; HRMS (ESI) Calcd. for C₂₂H₃₀NaO₃Si [M+Na]: 393.1858. Found: 393.1862.

Oxime 14. The lactol **13** (2.8 g, 7.6 mmol) was then taken up in pyridine (15 ml). To this was added anhydrous magnesium sulfate (MgSO₄) (1.8 g, 15.2 mmol) and hydroxylamine hydrochloride (791 mg, 11.4 mmol). This was allowed to stir at room temperature for 36 h. To work up, the reaction mixture was filtered through Celite, which was subsequently washed with 1:1 dichloromethane/hexanes and then dichloromethane. The resulting solution was concentrated, azeotroped with hexanes, and subjected to column chromatography (5% → 10% → 15% → 30% → 50% ethyl acetate/hexanes) to provide oxime **14** as an oil in a 1:1 mixture of *E/Z* isomers (2.9 g, 100%). ¹H NMR (400 MHz, CDCl₃) δ 9.16 (br, s, 1H), 8.81 (br, s, 1H), 7.71–7.66 (m, 8H), 7.45–7.35 (m, 12H), 7.26 (t, *J*=6.3 Hz, 1H), 6.67 (t, *J*=5.5 Hz, 1H), 4.15 (m, 2H), 3.94 (m, 2H), 2.63–2.41 (m, 5H), 2.30 (ddd, *J*=14.6 Hz, 6.6 Hz, 4.4 Hz, 1H), 1.66–1.52 (m, 4H), 1.069 (s, 9H), 1.065 (s, 9H), 1.05 (d, *J*=6.2 Hz, 6H); ¹³C NMR (100 MHz, CDCl₃) δ 149.54, 148.81, 148.64, 136.02, 135.99, 133.48, 133.47, 133.38, 133.33, 130.09, 127.89, 69.73, 69.24, 64.60, 64.52, 45.08, 44.63, 36.70, 32.38, 27.11, 23.78, 19.35; IR (thin film): 3268 (br, m), 2931 (m), 2858 (m), 1428 (m), 1112 (s), 738 (m), 703 (s) cm⁻¹; HRMS (ESI) Calcd. for C₂₂H₃₁NNaO₃Si [M+Na]: 408.1969. Found: 408.1971.

Nitrone precursor 10. To a solution of oxime **14** (2.9 g, 7.6 mmol, azeotroped in toluene) in dichloromethane (75 ml) was added imidazole (1 g, 15.2 mmol). The solution was cooled to 0 °C in an ice bath and tertbutyldimethylsilyl chloride (0.6 g, 4 mmol) was added. The reaction was stirred cold for 45 min. Then, another portion of tertbutyldimethylsilyl chloride (0.6 g, 4 mmol) was added and the reaction was allowed to gradually come to room temperature overnight. The reaction was quenched with ammonium chloride (NH₄Cl) (50% sat., aq. soln.) and the aqueous layer was extracted with diethyl ether. The organic extracts were washed with brine, dried (Na₂SO₄), concentrated and purified by flash chromatography (0% → 2% → 4% → 8% → 15% ethyl acetate/hexanes) to yield the TBS-protected oxime as an oil with a 1:1 mixture of olefin isomers (3 g, 79% yield). ¹H NMR (400 MHz, CDCl₃) δ 7.73–7.68 (m, 8H), 7.47–7.37 (m, 12H), 7.33 (t, *J*=6.3 Hz, 1H), 6.85 (t, *J*=5.4 Hz, 1H), 4.17 (m, 2H), 4.01 (m, 2H), 2.70 (ddd, *J*=15.6 Hz, 7.1 Hz, 5.5 Hz, 1H), 2.57 (ddd, *J*=15.7 Hz, 9.9 Hz, 5.1 Hz, 1H), 2.53 (dt, *J*=14.5 Hz, 6.6 Hz, 1H), 2.5 (d, *J*=3.0 Hz, 1H), 2.31 (ddd, *J*=14.5 Hz, 5.9 Hz, 4.3 Hz, 1H), 2.27 (d, *J*=3.2 Hz, 1H), 1.61 (m, 5H), 1.093 (d, *J*=6.0 Hz, 3H), 1.09 (s, 18H), 1.07 (d, *J*=6.4, 3H), 0.92 (s, 9H), 0.91 (s, 9H), 0.14 (s, 6H), 0.13 (s, 6H); ¹³C NMR (100 MHz, CDCl₃) δ 152.31, 152.10, 136.06, 136.01, 133.53, 133.46, 133.38, 133.25, 130.13, 130.11, 127.93, 127.90, 69.99, 69.48, 64.49, 64.31, 44.99, 44.03, 36.52, 32.86, 27.14, 26.23, 26.16, 23.82, 19.39, 19.34, 18.29, 18.23, –5.14, –5.16; IR (thin film): 3452 (br, m), 2931 (s), 2858 (s), 1472 (m), 1112 (s), 703 (s) cm⁻¹; HRMS (ESI) Calcd. for C₂₈H₄₆NO₃Si₂ [M+H]: 500.3020. Found: 500.3016.

A solution of the TBS-protected oxime (1.1 g, 3.6 mmol) and pyridine (10 ml) in dichloromethane (30 ml) was cooled to 0 °C in an ice bath. To this was added tosyl chloride (2.7 g, 14.4 mmol). The solution was allowed to gradually warm to room temperature overnight (20 h). The reaction was quenched with CuSO₄ (10% aq. soln.) and the aqueous layer was extracted with diethyl ether. The combined organics were washed with water and brine, dried (Na₂SO₄) and concentrated. The crude oil was purified by flash chromatography (1% → 2% → 3% ethyl acetate/hexanes) to provide tosylate **10** (1.3 g, 81% yield) as a 1:1 mixture of *E/Z* olefin isomers, which was either used immediately or temporarily stored as a solution (1 M in benzene, over molecular sieves) in the freezer. ¹H NMR (400 MHz, CDCl₃) δ 7.55–7.49 (m, 12H), 7.34–7.21 (m, 12H), 7.16 (t, *J*=6.2 Hz, 1H), 7.13 (d, *J*=7.4 Hz, 4H), 6.70 (t, *J*=5.2 Hz, 1H), 4.46 (m, 2H), 3.75 (quintet, *J*=5.7 Hz, 2H), 2.30 (dt, *J*=16.0 Hz, 5.4 Hz, 1H), 2.29 (s, 6H), 2.26 (dt, *J*=16.0 Hz, 5.6 Hz, 1H), 2.13 (dt, *J*=14.6 Hz, 6.3 Hz, 1H), 2.06 (ddd, *J*=14.6 Hz, 6.2 Hz, 4.9 Hz, 1H), 1.74 (ddd, *J*=14.5 Hz, 7.5 Hz, 6.1 Hz, 1H), 1.68 (dd, *J*=14.0 Hz, 7.2 Hz, 1H), 1.49 (tt, *J*=14.0 Hz, 5.7 Hz, 2H), 0.93 (d, *J*=6.3 Hz, 3H), 0.907 (s, 9H), 0.903 (s, 9H), 0.89 (d, *J*=3.0 Hz, 3H), 0.79 (s, 9H), 0.77 (s, 9H), 0.005 (d, *J*=2.5 Hz, 6H), 0.00 (s, 6H); ¹³C NMR (100 MHz, CDCl₃) δ 18.20, 18.25, 19.35, 19.39, 21.27, 21.47, 21.74, 26.15, 26.22, 27.08, 33.09, 37.22, 44.25, 44.62, 68.30, 68.71, 77.88, 77.96, 127.70, 127.72, 127.81, 127.83, 127.85, 129.81, 129.93, 129.97, 133.64, 133.70, 133.77, 134.81, 134.87, 135.93, 135.95, 135.98, 144.46, 144.49, 152.09, 152.18, –5.11, –5.15; IR (thin film): 2931 (m), 2858 (m), 1363 (m),

1177 (s), 1111 (m), 919 (m), 703 (m) cm^{-1} ; HRMS (ESI) Calcd. for $\text{C}_{35}\text{H}_{52}\text{NO}_5\text{Si}_2$ [M+H]⁺: 654.3105. Found: 654.3113.

Isloxazolidines 15a and 15b. To a solution of the nitron precursor **10** (118 mg, 0.18 mmol) in benzene (900 μl) was added MgSO_4 (43 mg, 0.36 mmol) and the enone **7** (24.5 mg, 0.06 mmol). Lastly, tetrabutylammonium difluorotriphenylsilicate (97 mg, 0.18 mmol) was added in two portions. This stirred at ambient temperature overnight (17 h). At that time, the heterogeneous mixture was diluted with dichloromethane (1 ml) and filtered through a celite plug. The filtrate was directly adsorbed onto silica gel and purified by flash chromatography (0% \rightarrow 2.5% \rightarrow 5% \rightarrow 20% ethyl acetate/hexanes) to provide two isloxazolidine diastereomers (39 mg total, 84% yield, **15a:15b** = d.r. 7:3), the desired isloxazolidine **15b** (12 mg) and the undesired diastereomer **15a** (27 mg), both as white foams. **Isloxazolidine 15a:** ^1H NMR (400 MHz; CDCl_3) δ 7.70 (m, J = 1.5 Hz, 4H), 7.57 (dd, J = 7.6, 0.9 Hz, 1H), 7.44–7.27 (m, 10H), 7.23 (d, J = 7.2 Hz, 2H), 6.91 (t, J = 7.9 Hz, 1H), 5.42 (m, 2H), 3.98 (br s, 1H), 3.79 (br m, 1H), 3.42 (br m, 2H), 2.90 (s, 2H), 2.44 (br m, 1H), 2.02 (d, J = 14.4 Hz, 1H), 1.91 (d, J = 14.4 Hz, 1H), 1.55 (m, 1H), 1.25 (m, 1H), 1.13 (m, 12H), 1.01 (s, 3H), 0.97 (s, 3H); ^{13}C NMR (100 MHz, CDCl_3) δ 14.35, 19.24, 19.99, 20.62, 22.44, 27.10, 32.31, 38.16, 39.59, 43.70, 44.96, 48.24, 48.67, 55.01, 61.28, 65.67, 77.36, 93.73, 102.10, 123.49, 125.97, 126.57, 127.20, 127.78, 128.65, 129.80, 129.86, 133.98, 134.02, 134.40, 136.01, 136.06, 137.78, 141.04, 180.54, 213.66; IR (thin film): 2930 (s), 1751 (s), 1718 (s), 1450 (m), 1104 (s), 733 (s) cm^{-1} ; HRMS (ESI) Calcd. for $\text{C}_{44}\text{H}_{49}\text{BrN}_2\text{O}_4\text{Si}$ [M+H+2]⁺: 779.2723. Spiroepoxide 16. To a solution of trimethylsulfoxonium iodide (145.3 mg, 0.66 mmol) in dimethylsulfoxide (2.2 ml) was added NaH (60% in mineral oil, 26.4 mg, 0.66 mmol). After stirring at room temperature for 4 h, the resulting homogeneous solution was added a solution of the ketone **15b** (170 mg, 0.22 mmol) in tetrahydrofuran (4.4 ml) and cooled to 0 °C in an ice bath to produce an opaque white solution. This was stirred at ambient temperature for 36 h, cooled to 0 °C and quenched with saturated NaHCO_3 solution. The mixture was diluted with H_2O and the aqueous layer was extracted with ethyl acetate. The combined organic portions were washed with brine solution, dried (Na_2SO_4), concentrated *in vacuo* and purified by flash chromatography (4% \rightarrow 8% \rightarrow 12% \rightarrow 30% ethyl acetate/hexanes) to provide the desired product **16** as a white foam (140 mg, 80% yield). ^1H NMR (400 MHz; CDCl_3) δ 7.72 (m, 4H), 7.42 (m, 6H), 7.34 (d, J = 8.3 Hz, 1H), 7.30 (m, 3H), 7.24 (d, J = 7.1 Hz, 1H), 7.21 (m, 2H), 6.87 (t, J = 7.8 Hz, 1H), 5.35 (s, 2H), 3.96 (s, 1H), 3.34–3.24 (m, 4H), 3.05 (s, 1H), 2.55 (d, J = 14.6 Hz, 1H), 2.43 (br s, 1H), 2.20 (d, J = 14.6 Hz, 1H), 1.90 (m, 1H), 1.84 (m, 1H), 1.62 (m, 1H), 1.28–1.09 (m: 9H; 3H; 3H; 1H), 0.72 (s, 3H); ^{13}C NMR (100 MHz, CDCl_3) δ 180.69, 141.14, 137.82, 136.56, 136.00, 134.11, 134.00, 129.87, 128.60, 127.78, 127.14, 126.68, 124.07, 122.57, 102.19, 91.85, 77.36, 65.72, 65.57, 59.19, 56.05, 55.21, 50.44, 49.64, 44.88, 39.55, 38.26, 36.92, 36.21, 34.81, 34.66, 32.45, 31.72, 29.20, 27.12, 27.06, 25.42, 23.48, 22.79, 21.00, 20.85, 19.32, 18.91, 14.26, 11.57; IR (thin film): 2930 (s), 1723 (s), 1450 (s), 1105 (s), 734 (s), 703 (s) cm^{-1} ; HRMS (ESI) Calcd. for $\text{C}_{45}\text{H}_{52}\text{BrN}_2\text{O}_4\text{Si}$ [M+H+2]⁺: 793.2880. Found: 793.2870.

Ammonium Salt 17. To a solution of the epoxide **16** (30 mg, 0.04 mmol) in acetonitrile/tetrahydrofuran (3:1, 0.6 ml) cooled to 0 °C in an ice bath was added NaI (30 mg, 0.2 mmol) and TMSCl (12.5 ml, 0.1 mmol). The clear

solution became yellow and a precipitate formed. After stirring for 4 hours, the reaction was diluted with Et_2O and washed with saturated $\text{Na}_2\text{S}_2\text{O}_3$ solution. (Note: DO NOT wash with brine solution.) The aqueous layer was extracted with ethyl acetate. The combined organic extracts were concentrated *in vacuo* and purified by flash chromatography (20% \rightarrow 40% \rightarrow 60% \rightarrow 80% \rightarrow 100% ethyl acetate/hexanes \rightarrow 5% methanol/dichloromethane) to provide the desired product **17** as a clear glass (26 mg, 70% yield). ^1H NMR (400 MHz; CDCl_3) δ 7.66 (m, J = 1.6 Hz, 4H), 7.54 (dd, J = 7.6, 1.1 Hz, 1H), 7.50–7.40 (m, 6H), 7.31 (dd, J = 8.2, 1.1 Hz, 1H), 7.28 (m, 1H), 7.22 (m, 1H), 7.13 (m, 2H), 6.89 (dd, J = 8.2, 7.6 Hz, 1H), 5.31 (s, 2H), 5.16 (d, J = 11.9 Hz, 1H), 4.10 (d, J = 11.9 Hz, 1H), 4.01 (m, 2H), 3.82 (m, 1H), 2.99 (q, J = 13.3 Hz, 2H), 2.81 (dd, J = 12.4, 8.0 Hz, 1H), 2.49–2.41 (m, 2H), 2.21 (m, 1H), 2.15 (dt, J = 15.6, 5.4 Hz, 1H), 1.84 (dd, J = 15.1, 4.6 Hz, 1H), 1.24 (d, 3H), 1.07 (s, 9H), 1.04 (s, 3H), 1.00 (s, 3H); ^{13}C NMR (100 MHz, CDCl_3) δ 193.83, 180.27, 140.10, 137.40, 135.83, 134.43, 132.87, 132.76, 130.50, 130.48, 128.71, 128.24, 128.21, 127.40, 127.22, 126.40, 123.95, 108.64, 102.07, 98.63, 86.22, 77.36, 75.58, 68.75, 65.64, 64.58, 61.68, 51.33, 46.51, 45.11, 36.22, 35.10, 29.86, 26.95, 26.35, 26.28, 20.70, 19.15, 13.36; HRMS (ESI) Calcd. for $\text{C}_{45}\text{H}_{52}\text{BrN}_2\text{O}_4\text{Si}$ [M+H+2]⁺: 793.2874. Found: 793.2861.

Diol 18. To a solution of this ammonium salt **17** (8 mg, 0.009 mmol) in tetrahydrofuran/acetic acid (180 μl /240 μl) was added activated zinc powder (4 mg, ~0.05 mmol). The reaction mixture was vigorously stirred under nitrogen for 18 h at ambient temperature, after which time the solvent had evaporated. The solvent mixture of tetrahydrofuran/acetic acid (180 μl /240 μl) was added again, and the reaction was stirred in a sealed flask for 2 more days. This was then filtered through a pad of Celite, rinsed with dichloromethane and concentrated *in vacuo*. The resulting yellowish oil was dissolved in dichloromethane, washed with NaHCO_3 (sat. aq. soln.) and the aqueous portion extracted with ethyl acetate/dichloromethane. The combined organic layers were concentrated and purified by flash chromatography (basic Al_2O_3 , 0% \rightarrow 1% \rightarrow 2% methanol/dichloromethane) to provide the desired product **18** as a clear oil (5 mg, 71% yield). ^1H NMR (400 MHz; CDCl_3) δ 7.65 (m, 4H), 7.48 (dd, J = 7.5, 1.1 Hz, 1H), 7.39 (m, 6H), 7.32 (dd, J = 8.1, 1.1 Hz, 1H), 7.28 (m, 2H), 7.21 (m, 3H), 6.93 (dd, J = 8.1, 7.5 Hz, 1H), 5.36 (s, 2H), 4.90 (d, J = 2.7 Hz, 1H), 4.31 (b s, 1H), 3.92 (tt, J = 11.0, 4.5 Hz, 1H), 3.23 (d, J = 10.2 Hz, 1H), 2.98 (m, 1H), 2.75 (tt, J = 11.1, 2.8 Hz, 1H), 2.47 (dd, J = 14.4 Hz, 1H), 2.22 (d, J = 10.2 Hz, 1H), 2.02 (d, J = 14.4 Hz, 1H), 1.82 (ddt, J = 12.2, 4.5, 2.4 Hz, 1H), 1.74 (td, J = 11.7, 4.7 Hz, 1H), 1.63–1.57 (m, 2H), 1.45 (dd, J = 13.0, 3.4 Hz, 1H), 1.32 (m, 1H), 1.22 (s, 3H), 1.05 (s, 9H), 0.87 (s, 3H), 0.75 (d, J = 6.9 Hz, 3H). ^{13}C NMR (100 MHz, CDCl_3) δ 185.31, 140.15, 137.31, 136.57, 135.89, 135.84, 134.76, 134.54, 133.70, 129.74, 129.72, 128.66, 127.71, 127.68, 127.27, 126.87, 126.59, 124.01, 102.23, 82.93, 81.97, 77.36, 66.16, 61.05, 56.35, 55.56, 52.49, 46.38, 46.06, 45.22, 43.74, 41.96, 36.13, 29.86, 27.19, 27.14, 21.68, 19.27, 11.79; IR (thin film): 3390 (br), 3069 (w), 2959, 2929, 2856, 1686 (s), 1450, 1359, 1106, 1064, 734, 701 cm^{-1} ; HRMS (ESI) Calcd. for $\text{C}_{45}\text{H}_{53}\text{BrN}_2\text{O}_4\text{Si}$ [M+H+2]⁺: 795.3036. Found: 795.3028.

Ring-fusion epoxide 19. To a solution of the diol **18** (116 mg, 0.141 mmol) in dichloromethane (3.0 ml) at room temperature was added MsCl (32.5 μl , 0.423 mmol), dropwise, and let stir for 5 min. To the resulting clear yellow solution was added triethylamine (0.2 ml, 1.41 mmol), dropwise, to give a dark orange, clear solution that was allowed to stir for 2 h, after which equal amounts of MsCl and triethylamine were again added and allowed to stir for 3 h. Methanol (3.0 ml) was added, followed by K_2CO_3 (0.083 g, 0.60 mmol), to give a cloudy orange reaction mixture. After 16 h, the reaction was quenched with NaHCO_3 (sat. aq. soln., 10 ml), extracted with dichloromethane/ethyl acetate, with combined organics washed with brine, dried over Na_2SO_4 and concentrated *in vacuo*. The resulting residue was dry loaded on silica and purified via flash column chromatography (5 \rightarrow 10 \rightarrow 20 \rightarrow 30 \rightarrow 50% ethyl acetate/hexanes+1% triethylamine ea.) to furnish the desired epoxide as an off-white foam (83.0 mg, 76% yield) and recovered starting material (29 mg). *Note:* To ensure reproducible ^1H NMR data, product was taken up in 10% methanol/dichloromethane, passed through a plug of basic alumina with 10% methanol/dichloromethane as eluent and concentrated *in vacuo*. ^1H NMR (500 MHz, CDCl_3) δ 7.67 (ddd, J = 8.1, 4.2, 1.5 Hz, 4H), 7.45–7.40 (m, 2H), 7.40–7.35

(m, 4H), 7.31 (dd, $J=8.2, 1.1$ Hz, 1H), 7.25 (d, $J=6.6$ Hz, 1H), 7.23~7.14 (m, 5H), 7.08 (dd, $J=7.6, 1.2$ Hz, 1H), 6.84 (t, $J=7.8$ Hz, 1H), 5.31 (s, 2H), 3.90 (tt, $J=10.4, 4.4$ Hz, 1H), 3.16~3.06 (m, 2H), 3.02 (dq, $J=7.3, 3.9, 3.5$ Hz, 1H), 2.60 (d, $J=14.6$ Hz, 1H), 2.58~2.52 (m, 1H), 2.19 (d, $J=14.6$ Hz, 1H), 1.92~1.77 (m, 3H), 1.69 (ddd, $J=12.2, 10.5, 4.5$ Hz, 1H), 1.64~1.57 (m, 1H), 1.33 (dt, $J=12.7, 10.6$ Hz, 1H), 1.06 (s, 9H), 1.01 (s, 3H), 0.94 (s, 3H), 0.71 (d, $J=6.6$ Hz, 3H). ^{13}C NMR (126 MHz, CDCl_3) δ 179.47, 140.70, 138.06, 137.99, 135.87, 135.82, 134.61, 134.46, 134.41, 134.12, 129.76, 129.73, 129.16, 128.41, 128.38, 128.35, 127.71, 127.68, 127.66, 127.07, 126.98, 125.43, 125.27, 122.51, 101.86, 70.14, 65.93, 65.55, 59.07, 52.47, 49.54, 47.93, 44.97, 44.66, 43.10, 42.15, 40.82, 31.89, 31.66, 27.11, 25.95, 21.60, 20.34, 19.23, 11.44. Found: 777.2910.

CONFLICT OF INTEREST

The authors declare no conflict of interest.

ACKNOWLEDGEMENTS

We thank Amgen, Bristol-Myers Squibb and the NSF (CHE-1058292) for their financial support. We are grateful for generous funding from Baylor University, the Welch Foundation (Chair, AA-006) and the Cancer Research & Prevention Institute of Texas (CPRIT, R1309). MEM is grateful for the support of the NSF GRFP (2013156410). TM is grateful to the Uehara Foundation; Professor Toshiaki Sunazuka, Professor Satoshi Ōmura and the Kitasato Institute for postdoctoral support. JAE thanks the NIH (GM095076) for a postdoctoral fellowship. Dr Chris Rithner, Don Heyse,

and Don Dick are acknowledged for their assistance in obtaining spectroscopic data.
